AutoCAD is used by the U.S. Department of Defense, various aircraft manufacturers, railroad companies, and many other businesses. It is also the most widely used CAD software in the world. Introduction and development AutoCAD is one of the first open-source CAD software products. It is supported by the Autodesk Community for All. The Autodesk Community for All provides the support and resources necessary to maintain and grow the Autodesk Software ecosystem. Autodesk started supporting the Autodesk Community for All in 2000. While CAD/CAM software has been available since the 1970s, AutoCAD was the first such product that was widely adopted by users outside of the engineering world. The first AutoCAD was written by Ed Griffiths and released in December 1982 as a "personal computer version" of the Sinclair QL CAD/CAM software. The first commercially available version, AutoCAD 1.0, was released on January 14, 1983. The original AutoCAD used an X-Y plotter to render the drawings. Beginning with AutoCAD 2.0, a better graphics processor was added, leading to the first versions of the software to be able to render wire-frame and solid models. As AutoCAD developed, different features were incorporated. The first commercial version, AutoCAD 1.0, was introduced in 1983. Originally only compatible with the X-Y plotter, AutoCAD 1.0 was improved for use on the Epson Artisan Scanner and some graphics boards. The first version of AutoCAD that could use the laser printer was AutoCAD 2.01, released in January 1985. The first versions of AutoCAD to incorporate DWG files, version 2.2 and later, were released in 1986. AutoCAD 3.0 was released in December 1987. The most widely used commercial release of AutoCAD is AutoCAD LT. It was released in September 1992 and continued to be developed and improved. AutoCAD LT is a smaller version of AutoCAD that runs on a machine with limited memory and the ability to run as a web application. Like the first commercial versions of AutoCAD, all AutoCAD versions are available for both Windows and Mac, and AutoCAD LT is only available for Windows. AutoCAD for Mac is currently available in macOS Catalina (10.15) only. AutoCAD for Windows is now

AutoCAD [Mac/Win]

In 1995, the programmatic interface to AutoCAD was released as "AutoCAD Automation". It was an ObjectARX-based system, that was used to create macros, add-on modules, and software packages. A subset of this work was included in the ArcInfo GIS software package, used for geographic information system. History In 1982, it was planned that the total cost of the proposed CAD system would be US\$4.5 million. The R&D division of the company was split off into a new company, General Motors R&D, as GM R&D in 1989. The same year, the main development team split off to work on the Archimedes effort. However, the CAD effort was seen by GM R&D as being too complicated, and the project was dropped. The CAD work was resurrected in 1990, and a co-op program between GM R&D and Harvard University allowed GM to use the architecture of the Archimedes design. Autodesk CAD software Autodesk first released AutoCAD in 1982. In 1983, it was the only commercial CAD system, but it was also the only one that allowed a non-licensed user to create drawings. Since then, Autodesk has not created new CAD software. In 2000, Autodesk released AutoCAD 2000, which was based on the General Motors CAD system. In 2004, the software was renamed to AutoCAD 2004. In 2006, it was renamed to AutoCAD 2007, and was the first release of AutoCAD that was fully rewritten from scratch. The user interface, fonts, and rendering have remained largely unchanged since the first release, but the architecture, process of creating drawings, file formats, and functionality have all changed. In January 2012, Autodesk released a new version of AutoCAD, AutoCAD 2012. The new version allowed for full-featured 3D, was easier to learn for people who were not programmers, and used the 64-bit architecture. It was the first release of AutoCAD that used a 64-bit architecture. In October 2014, Autodesk released a new version of AutoCAD, AutoCAD 2014. The new version had a more "CAD friendly" interface, and was more user-friendly for those not familiar with programming. It also allowed users to create 3D objects, edit the X, Y, Z coordinates of geometric objects, make annotations on a1d647c40b

#### What's New In AutoCAD?

Export and import parametricized data for your models and drawings in three different formats. Use our built-in export and import services to use any text, vector or graphic format as models, drawings or animations. The service provides an easy way to format your files for the CAD format you need. (video: 1:10 min.) Use the new Markup Assist service to see a small model of your drawing, send feedback to the drawing, add your comments, and send the drawing back to your design team. Use the new Markup Import service to quickly import drawings to mark up in AutoCAD. (video: 1:32 min.) Markup Stamp: Drag and drop features for markups on your drawing in a more intuitive way with the new Markup Stamp tool. (video: 1:19 min.) See these new features for yourself in our 2019 CAD Recap video [here](#).

Q: Array.map() receives two arrays as arguments - how to map one of the arrays? I am using angularjs, and I want to extract an array from a JSON file. I am using the following code to try to extract a particular array from the file: `$scope.items = ($scope.items || []); $scope.items = $scope.items.map(function(data) { return data.name; });` This works, and it will extract the name array out of the items array (it's inside an object). My issue is that the data array is also inside an object, which I don't know how to handle (because it is inside an array of objects, all nested inside one another). I have two options to handle this - one option is to search through the array for the data array and just grab that element, and the other option is to do something like this: `var custom_items = data.custom[0].items || []; $scope.items = $scope.items.map(function(data) { return data.name; });` I was hoping that the second one would work, but it throws an error stating that the value is undefined. If anyone could help me out, that would be great.

A: No reason to use map for this, just use filter: `$scope.items = $scope.items || []; $scope.items = $scope.items.filter(function (item)`
