The team has submitted the genome to GenBank, which will soon be made available to the scientific community through a new portal on the United States National Library of Medicine's website. "It's important because the human gut microbiome represents an ecosystem of about 100 trillion microbial cells, and bacteria play key roles in maintaining human health," said Genomics and Bioinformatics Program Leader Nissar Ahmed, Ph.D., who led the research. "This is the first proof of concept for the human microbiome project, and it shows how complete draft genomes can be generated." WSU's bacterial genome was sequenced using the Pacific Biosciences platform. The genome, which was previously identified only through traditional techniques, is the first of its kind from an adherent probiotic bacteria strain, which are bacteria that are shown to be beneficial to the health of the host. The draft genome sequence provides data from the DNA that is present in the microbe and the plasmids, or extra-chromosomal DNA, that it carries. The sequencing of a complete genome sequence provides a digital record of a bacterium's DNA, and will help researchers better understand this organism's functions and the ways in which it interacts with other microbes in the body. "The study of microbial genomes can teach us about a host organism's species, as well as about how the host organism and the microbe interacts with each other," said Sanjib G. Ray, WSU researcher and the lead author of the paper. The research also included David N. Monacelli, Ph.D., and Florentin A. Spindler, Ph.D., of Pacific Biosciences, who helped perform the Occ13bf012
