Editing and modifying images should always be done in a well-lit environment. Also, make sure you are comfortable with the tools you choose to be used to add or modify images. Before you start working with Photoshop, you need to know how the program works. In this chapter, I provide a short introduction to the Photoshop interface and provide practical examples of how to use key tools, such as the Rectangle and Lasso tools. Finally, I show you how to put the pieces together to create a photo project. In Chapters 5–1 explore the myriad of ways in which you can modify images using Photoshop. ## Getting Started with Photoshop A computer with Photoshop installed and a reasonable amount of memory is all that you need to get started with Photoshop. Check your specifications to make sure that your computer meets the minimum requirements. When you're ready to launch Photoshop, start by doing a bit of housekeeping. Just as your computer has a clock, it also has a toolbar on the bottom. If you're using a PC, look for a toolbar on the lower right side of the screen. You can also use the View Options/Settings icon in the upper-right corner to access this toolbar: After this initial splash screen, you see the splash screen on the left side of Figure 2-1. This splash screen provides a jump-start to getting you on your way, as you can see in the next few steps. FIGURE 2-1: The launch screen gives you the basics. Figure 2-2 shows the splash screen's view options. Click the appropriate option to make it your new default view: FIGURE 2-2: Make your default view with the View drop-down menu. The Zoom tool is probably your best friend when you start using Photoshop, so I include a brief discussion about it in this section. The Zoom tool enables you to magnify the image in the active window by 10 to 200 percent. The Zoom tool also enables you to choose the view mode that you prefer to work with: \* \*\*View:\*\* The View setting decides which interface elements appear on your screen at a given time. The default setting is Wireframe, which shows only image data. If you click the Flip button (the cross), you can see a tonal map that shows the image at different levels of gray. If you have a photo on the screen, the cross button also displays an Eyedropper tool, so you can select

Metabolism of FGF2, a member of the growth factor family. Metastatic solid tumors are amongst the leading causes of death in patients. Previous studies have shown that fibroblast growth factor 2 (FGF2) is a major mediator of tumor growth and its expression is enhanced in cancer cells, suggesting that it acts as an autocrine growth factor. A role for FGF2 in the regulation of tumor angiogenesis has also been suggested. In the present study, the metabolism of FGF2 was studied in vitro in normal human diploid fibroblasts and in a 3-D system using human dermal fibroblasts and mouse embryo. Degradation of FGF2 was demonstrated to occur predominantly through its conversion to FGF2-(1-73) and the C-terminal fragment FGF2-(1-50), but was also found to occur to a lesser extent through the removal of its N-terminal region. These results also confirmed that formation of the FGF2-(1-73) was most likely via the C-terminal autocleavage of FGF2, while formation of the N-terminal fragment was due to proteolytic cleavage of the N-terminal region after Arg(31) or Arg(33). Analysis of the in vitro products from the N-terminal and C-terminal fragments of FGF2 revealed an N-terminal sequence of Arg(2)-Pro(7)-Ser(8)-Leu(9)-Asp(10)-Asn(11)-Asp(12)-Lys(13)-Pro(14)-Met(15) and C-terminal sequence of Glu(17)-Lys(18)-Pro(19)-Ser(20)-Arg(21)-Ile(22)-Pro(23)-Lys(24)-Ser(25)-Tyr(26)-Glu(27)-Pro(28)-Thr(29)-His(30) and Arg(31)-Arg(32)-Lys(33)-Cys(34), respectively. While some of us might be getting a bit sick and tired of Pokemon Go, all it takes is the announcement of the rival switch and then boom, the hype begins anew! This time, it's not a new type of Pokemon, it's a new type of Trainer. I have to admit, I was immediately intrigued when I saw the trailer. I've played many games where

1. Technical Field The present disclosure relates to a catheter apparatus and, more particularly, to a catheter apparatus configured to provide localized heating in a defined region of a subject's tissue. 2. Background of Related Art Localized heating of soft tissues in and around internal cavities has become a desirable treatment in a variety of different medical conditions. For example, ablation of various tissues is typically used to treat cardiac arrhythmias by destroying the tissue that will disrupt the abnormal patterns of electrical activity believed to be responsible for the arrhythmia. Localized heating of soft tissue may also be used to treat certain malignant tumors. Localized heating destroys the tissue through thermal necrosis, which may be distinguished from thermal coagulation, which may char or denature proteins, but does not actually destroy the tissue. A variety of treatment protocols are currently employed for achieving the localized heating in a body region, such as the heart. The standard ablation protocol involves positioning a radio frequency ("RF") probe at the target site to be treated, including the front and back surfaces of the heart wall, and delivering power to the probe. RF ablation probes are typically inserted into the heart through a catheter, and are guided to the target site by a cardiovascular imaging system, such as a fluoroscopy system. The tissue is typically treated by applying energy to the tissue located at the tip of the probe, which is typically heated to about 50 to 100° C. by an internal heating element. This creates a lesion, which may be a region of coagulation and/or necrosis of tissue, on the order of about 5 to 20 mm in length. This ablation procedure is repeated until a desired lesion is formed or until a predetermined total energy level is exceeded. The above described traditional method of ablating tissue is a passive heating method. In some cases, other active systems are available. For example, some HF or microwave frequency systems may be used to treat some areas. Conventional techniques are however, limited in that they usually are unable to use imaging to assess the effectiveness of the treatment. If active heating is used, some techniques are available to evaluate and determine the effectiveness of the treatment. For example, it is possible to use a standard impedance system to map and estimate lesion size. This is typically achieved by implanting one or more electrodes into the region to be treated and applying the appropriate electrical current to the electrodes to give a current density and characteristic impedance.
