
PICVideo MJPEG Codec 3 Full Version =LINK=

Download

constant value: 2 (0x00000002)

configure_flag_session_callback added in api level 30 public static final int configure_flag_session_callback if this codec is to be used with a mediametadataretriever , pass this flag. if this flag is set, the following apis throw incompatiblewithmetadataretrieverexception .

getavailablemetadata() getmetadata(string)

getmetadata(string, string) a video for windows codec on the windows platform is pretty simple: shove one raw frame in, get one compressed frame out. great fun for the whole family and works in reverse as well. this means that audio and video codecs are separate, and in addition, the frame order must be progressive in the compressed stream.

unfortunately, mpeg-1 uses a completely different file layout than avi, and in addition, reorders i and p-frames relative to b-frames in display order. the different file order makes it impossible to retrofit mpeg-1 support onto applications with codecs alone, and the frame order issue means you can't truly fit mpeg-1 video into avi. constant value: 4

(0x00000004) configure_flag_reorder_block_pixels added in api level 30 public static final int

configure_flag_reorder_block_pixels if this codec is to be used with a mediametadataretriever , pass this flag. if this flag is set, the following apis throw incompatiblewithmetadataretrieverexception .

getavailablemetadata() getmetadata(string)

getmetadata(string, string)

PICVideo MJPEG Codec 3 Full Version

constant value: 0xffffffff parameter_key_hdr10_plus_info added in api level 29 public static final string parameter_key_hdr10_plus_info set the hdr10+ metadata on the next queued input frame. provide a byte array of data that's conforming to the user_data_registered_itu_t_t35() syntax of sei message for st 2094-40. for decoders: when a decoder is configured for one of the hdr10+ profiles that uses out-of-band metadata (such as mediacodecinfo.codecprofilelevel.vp9profile2hdr10plus or mediacodecinfo.vp9profile3hdr10plus), this parameter sets the hdr10+ metadata on the next input buffer queued to the decoder. a decoder supporting these profiles must propagate the metadata to the format of the output buffer corresponding to this particular input buffer (under key mediaformat#key_hdr10_plus_info). the metadata should be applied to that output buffer and the buffers following it (in display order), until the next output buffer (in display order) upon which an hdr10+ metadata is set. this parameter shouldn't be set if the decoder is not configured for an hdr10+ profile that uses out-of-band metadata. in particular, it shouldn't be set for hdr10+ profiles that uses in-band metadata where the metadata is embedded in the input buffers, for example mediacodecinfo.codecprofilelevel#hevcprofilemain10hdr10plus or mediacodecinfo.codecprofilelevel#vp9profile2hdr10plus . 5ec8ef588b
