We use them when we need to send a message to someone via email, write a comment on a social media site, visit a web page, or simply access our bank accounts. If you use the same set of characters over and over again, however, you open yourself up to the risk of having a hacker crack your password and gain access to your online accounts. I have a brand new computer that only had a one month old backup. I'm not sure if this is a virus or something else, but it worked. The backup was stored in my google drive, so I deleted the backup and restored a new one from google drive and then restored the contents from my computer.
