While Photoshop has a basic feature set, you also gain a lot of power with its advanced selections. The key is choosing layers in a smart, effective manner. Similarly, Layer Masks are available in Photoshop, but they are not able to be edited in any way or used to mask out areas of the image, which means they are still kind of flat. Adobe Photoshop features are organized in a tabular structure. This is why it is easier to use the application. Figure 70 will educate you about the tabular structure. The three tabs on the left side will tell you what the tool is used for. At the top, Toolbox is used for viewing a collection of tools. From left to right, there is the Move Tool for moving objects, the Pencil Tool for drawing lines, the Eraser Tool for erasing unwanted things, the Paint Bucket Tool for applying colors, the Gradient and More Tools, and the Text Tool for creating text. The bottom is the Command bar, and contains tools for adjusting and managing layers, playing with in-app assets, and more. The Lightroom tab is for managing the in-app assets you collect from files. In the left pane, you can add tools to create special effects. There are tools for applying adjustments, masking, cloning, erasing, and more. You can also choose from a variety of special effects, filters, and overlays On the right side, you can choose what tool to apply to an object. There are options for making old an object disappear, applying effects with adjustments settings, or cloning it from the canvas. Also, via the Adjustments panel, you can make a color change, add background blurring, modify lighting, and make a ton of image adjustments. In the Properties panel, you can change position, size, and other associated properties.

Find the balance between the trichromatic and dichromatic colors in an image by using the Color Lookup Table tool, which is one of the most useful tools in Adobe Photoshop. You can use it to edit the tints and hues in an image in order to enhance its vibrancy. With just a few clicks, you can add the color you want to a scene without replacing the original colors that the object contains. Photoshop is a raster-based image editing tool, which means that images are made up of tiny squares or pixels that represent colors. If you want to create a simple image, you begin with a blank screen: you can add color to the screen by placing the color you want in a space that has no color on it. If you want to change the color of one space, you select the color you want by going to "Edit" and clicking on "Fill." If you want to change the color of many or all of your image, you appears on that color space. Use the sliders to move a selection, or drag a shape made up of several colored pixels to an area with a color you want. (Previously, you had to use Paint Bucket to place color on a space that was blank. Now, you can select a color and drag it over to the area you want.) If you want to change more than one object at once, you find selecting the objects by going to "Edit > Select >" and then clicking on the objects. You repeat this process to place each object on the screen. The first thing you do with Photoshop is to click the "Create" button on top of the screen. To edit text, you place the cursor over the text and press the letter you want to change. To change letters in multiple documents, you click on the "Select All" button in the toolbar, then click on the letter you want to change. If you want to change more than one letter at once, you select all the letters and then do the same thing, selecting the word you want to change (for example, "Prepare for a trip").
