As you create a new canvas, Photoshop previews the file on an area called the canvas area. From there, you can create and edit layers, which act like pages in a book; move, resize, and resize them, use filters and masks to manipulate the image, or add effects to them.

Photoshop includes a number of tools that let you create images, all from the perspective of using the image as a means of creating. In this chapter, we'll go over tile and magnet tools, as well as more complex image manipulations.

With the artistic and adjustments captured, you can either save your image to the computer or to the Internet to share your work. To save your file as a web-ready image, drag your canvas to the Desktop. There, click **File>Save**. In the dialog box that appears, you can save the image as a web-ready file for the Internet or as an image for your computer. If you're a web designer, it's best to save your file as a web-ready file so that you can upload to sites such as Blogspot or your personal website; it will appear just like any other web-ready file you've uploaded.

To create a canvas file from your camera, iPhone, or other device, take a picture. If you've got a Mac on hand with Photoshop open, then you can drag the image to Photoshop desktop to add it to the workspace.

The Adobe Photoshop module works inside Adobe Lightroom CC. When you are using the widget, it lists all the tools and actions you have available in one place. It shows your currently used toolbox and also provides the latest alphabets list with the most recent installed actions.

For overall image adjustment, you can use the Adjustment panel. The Adjustment panel allows you to play with the color balance, contrast, brightness, and the levels. The Adjustments panel can be used to make changes to brightness, color, contrast, and contrast for an image. You can also use the **Gradient** function of the Adjustment panel to create a gradient fill and the **Shadow** function to lighten or darken shadows. Once you make adjustments, they are available to view on one layer. To do this, you need to use the **Photoshop Layers > Add a new layer** option. This will bring up a new layer on the layered Photoshop document. You can preview the result on the new layer and add more effects if you desire. Once you have your new layer just created please click on the **Layer > Layer Mask** option to enable layer masks. Layer masks are the second layer list, where each layer on an image can be turned on or off for a specific effect. You need to use the **Layer > Layer Mask** option. This will bring up a layer mask overlay on the layer you have just added. When you add a layer mask on a layer, the image appears darker than before. This decreases the opacity of the layer. In some situations, you need to go to the **Layer > Layer Mask > Unlock** function to adjust the layer mask. This may be done to remove a layer mask that does not need to be changed or followed by unlocking the layer mask function to develop the layer mask. In Photoshop CC the layer mask function is a little bit different.
