The software's user interface is so complete and intuitive I found myself doodling around on the canvas with brushes and paint, and that's the easiest way to speed up graphic design. In the software, there are practically no out of the way panels and no hidden tools. Of course, might-required programs like Adobe Acrobat X and the intended watermarking function don't yet work with the application, but in response to Photoshop's acquisition of capabilities such as shape editing with Illustrator and Paint, a number of applications such as the GIMP, Inkscape, and Adobe Fireworks have all introduced some vectorshape capabilities. The Creative Suite has an auto imposition feature that will automatically place multiple images within the frame of a single image; Photoshop Elements has some nice features as well, but even Photoshop's now got some impressive features in its "Practice Tools" (see below).

There is no denying it that Photoshop is by far the most popular tool for photo editing in the world. Once you buy the Creative Suite you will be given 40GB of free storage space (the Starter Edition of Adobe Photoshop has 10GB), and photoshop.com is free throughout. All of the current versions of Photoshop are free to download to your MacBook Pro, MacBook, and Macbook Air users. In addition, Photoshop CC for Mac, and Photoshop Elements 10 have also been made available as free downloads, and the previous versions are still available too, if newer versions are more up to date.

This experiment is part of our mission to democratize creativity. We've been exploring how the web can act as a creative canvas for people who want to make art work. While Photoshop may not be the only product we work on, we wanted to start with a piece of software that people are familiar with and can easily get access to.

With Photoshop Camera, we're bringing the power of Adobe Photoshop to the web. We worked directly with the community to ask what they wanted but also to ensure that the web as we know it continues to be what people want it to be. To make this possible, we used tools like WebAssembly to build and run a Photoshop application inside of a web browser. This also gave us unparalleled access to performance through browser debugging tools and WebAssembly in general. We also used technologies like Webpack , Chromium Widgets , Emscripten , Stylus , Lit , Workbox , and WebExtensions to explore real-world use cases and how to build apps for the web through interfaces from the past.

We made a lot of compromises to make this possible. WebAssembly optimizations were not available, for instance, and we couldn't use the native toolbox, but that was OK. Fundamentally, we wanted the same experience as running Photoshop on your computer. The most obvious differences of Photoshop Camera over Adobe Photoshop are that it runs on a web browser and the UI is mostly a web page.

While it's great to be able to tap into everyone's creativity, we also want to make sure that everyone has access to the tools that it takes to get their ideas to life. Adobe's commitment to the web is part of our vision for deeper integration of content across all of our products. We're excited to partner with and support others to bring the web into every creative workflow as the connections between app and device become closer. It's our goal that Photoshop becomes deeply integrated into web platforms as you use them for creative purposes.
