In version 20.0, the company partnered with the GPU Cloud to recognize that users already have the latest available graphics cards installed and compatible with Photoshop. The company also updated some of its tools to run in “dark mode,” a nod to the fact that some of Photoshop’s tools are used at night and in a dimly lit room. Version 20.0 also includes new features for retouching. For example, the Shadow Clipping brush is equipped with a Touch-Sensitive brush pen, which lets you close it with your finger to brush or scrub the brush into an area. Adobe Photoshop has always had a reputation for being a powerhouse photo editing tool. Many editors absolutely adore the work they can do with Photoshop. However, image manipulations are just one of the other ways that Photoshop can be used. And with the update, you can add even more utility to your workflow. Without real-time feedback, making corrections and adjustments to still photos can be slow, tedious and inelegant. In addition, many photographers who use Photoshop for image editing have been frustrated by the lack of solid tools for customizing or creating smart objects, layouts or forms. The new Edge Detection creates a sort of “template” of an area of a photo, allowing you to color, crop or resize the object and then apply the selection to other images. Part of the complexity of the task is captured by the concept of “Angle of View.” The setting is useful for everything from taking a photo portrait of a friend to printing photo prints that are square. When the setting falls off, the photo flips and becomes wider instead of taller. So in addition to height, you are now dealing with width and you must also conform to the “angle.” Adobe’s Angle of View setting is perfect for a few shots, but not for full-length portraits, where the “stretch” will be poorly applied.
